

In the Abstract

Kindly amend the Abstract to read as follows:

ABSTRACT OF THE DISCLOSURE

An interactive education support system utilizes a student identification database to provide a secure environment for the collection, storage and controlled dissemination of graded materials. A unique student identification is affixed to a gradable material, such as a test. The identifier may be affixed to the material either before or after it is disseminated to the student associated with the identifier, who enters his or her work on the material, after which the material is collected and reviewed, the educator placing review data, such as a grade and/or comments, on the material. An image of the reviewed material is captured and stored for access in a database ~~and is associated with at least the unique student identifier. in a secure manner, such as through the Internet.~~ The original material may then be returned to the student. ~~The stored image can be accessed in a controlled manner by electronic means, such as through the Internet, by individuals such as the student's parents, guardians and/or school administrators, whereby the integrity of the original reviewed document is preserved.~~
